

南京大学本科生实验报告

课程名称：计算机网络

任课教师：田臣/李文中

助教：洋溢

学院	计算机	专业（方向）	计算机科学与技术
学号	221220142	姓名	欧阳瑞泽
Email	221220142@smail.nju.edu.cn	开始/完成日期	2024.3.10

Lab 1: Switchyard & Mininet

1. 实验目的

配置实验环境，修改实验代码，完成包括修改 Mininet 拓扑结构、统计数据包、修改设备的测试场景、在 Mininet 中运行设备、使用 Wireshark 抓包的五个步骤。

2. 实验内容

Step 1: Modify the Mininet topology

Delete server2 in the topology:

通过阅读手册，得知 `start_mininet.py` 通过 `__init__(self, args)` 函数初始化网络的拓扑结构，而函数中通过循环遍历 `nodes` 建立拓扑结构，所以只需在遍历至 `server2` 时 `continue`，就可以在建图时将 `server2` 从网络中删除。后续 `setup_addressing(net)` 函数中也需将 `server2` 去除。

Step 2: Modify the logic of a device:

新增两个变量对 `packet` 进行计数，每当新 `packet` 进出 `hub` 时，更新变量，最后输出。值得注意的是，统计发出的 `packet` 时，发送给 `hub` 自己的不被统

计。

Step 3: Modify the test scenario of a device
Create one test case by using the given function new_packet with different arguments:

使用 new_packet 函数制作一个新包。仿照 case3，修改 mac 参数，设计一个发送至 hub 的包，由于 hub 不会转发，可知统计包数量的 in 增加，out 不变。

Step 4: Run your device in Mininet

在 mininet 中运行。开启 mininet，打开 xterm，分别激活环境，在 mininet 中测试 pingall，验证网络。

Step 5: Capture using Wireshark

在 mininet 中输入 server1 wireshark &，选择 client-eth0，再让 client ping server1。抓取 ARP 协议的包。最后导出 pcapng 文件。打开包的详细内容，可以得知以下信息：

No.	Time	Source	Destination	Protocol	Length	Info
1	0.000000000	30:00:00:00:00:01	Broadcast	ARP	42	Who has 192.168.100.1? Tell 192.168.100.3
2	0.334042459	Private_00:00:01	30:00:00:00:00:01	ARP	42	192.168.100.1 is at 10:00:00:00:00:01

 ▶ Ethernet II, Src: 30:00:00:00:00:01 (30:00:00:00:00:01), Dst: Broadcast (ff:ff:ff:ff:ff:ff)
 ▼ Address Resolution Protocol (request)
 Hardware type: Ethernet (1)
 Protocol type: IPv4 (0x0800)
 Hardware size: 6
 Protocol size: 4
 Opcode: request (1)
 Sender MAC address: 30:00:00:00:00:01 (30:00:00:00:00:01)
 Sender IP address: 192.168.100.3
 Sender MAC address: 00:00:00:00:00:00 (00:00:00:00:00:00)
 Target MAC address: 192.168.100.1

Hardware Type: 所使用的硬件类型

Protocol Type: 上层协议的类型。

Hardware Address Length: 指定了硬件地址的长度

Protocol Address Length: 了网络层地址的长度

Opcode: ARP 请求的类型

Sender Hardware Address: 发送 ARP 请求或应答的设备的硬件地址

Sender Protocol Address: 发送 ARP 请求或应答的设备的协议地址

Target Hardware Address: ARP 应答中的目标设备的硬件地址。

Target Protocol Address: 目标设备的协议地址

3. 实验结果

Step 1: Modify the Mininet topology

Delete server2 in the topology:

删除 server2 后通过 mininet 查看网络拓扑结构，发现并无 server2

```
mininet> net
client client-eth0:hub-eth1
hub hub-eth0:server1-eth0 hub-eth1:client-eth0
server1 server1-eth0:hub-eth0
mininet> nodes
available nodes are:
client hub server1
```

Step 2: Modify the logic of a device:

在控制台输出的 log 如下，由于 Step3 中设计了发送至 hub 的包，所以 in 和 out 的数量可能不同。

```
(cyenv) njucs@njucs-VirtualBox:~/CN/Lab1$ swyard -t ./testcases/myhub.testscenario.py myhub.py
14:10:42 2024/03/10 INFO Starting test scenario ./testcases/myhub.testscenario.py

4. 核心代码

Step 1: Modify the Mininet topology

Delete server2 in the topology:

```
for node in nodes.keys():
    if node == "server2":
        continue
    self.addHost(node, **nodeconfig)
for node in nodes.keys():
    # all links are 10Mb/s, 100 millisecond prop delay
    if node == "server2":
        continue
    if node != "hub":
        self.addLink(node, "hub", bw=10, delay="100ms")

def setup_addressing(net):
    for node, config in nodes.items():
        if node == "server2":
            continue
        reset_macs(net, node, config["mac"])
```

Step 2: Modify the logic of a device:

```
while True:
    try:
        _, fromIface, packet = net.recv_packet()
    except NoPackets:
        continue
    except Shutdown:
        break

    sum_in += 1
    log_debug(f"In {net.name} received packet {packet} on {fromIface}")
    eth = packet.get_header(Ethernet)
    if eth is None:
        log_info("Received a non-Ethernet packet?!")
        return
    if eth.dst in mymacs:
        log_info("Received a packet intended for me")
    else:
        for intf in my_interfaces:
            if fromIface != intf.name:
                log_info(f"Flooding packet {packet} to {intf.name}")
                net.send_packet(intf, packet)
                sum_out += 1
    log_info(f"in:{sum_in} out:{sum_out}")
```

Step 3: Modify the test scenario of a device

```
# test case 4: a frame with dest address of one of the interfaces should
# result in nothing happening
reqpkt = new_packet(
    "20:00:00:00:00:02",
    "10:00:00:00:00:03",
    '192.168.1.100',
    '172.16.42.2'
)
s.expect(
    PacketInputEvent("eth2", reqpkt, display=Ethernet),
    ("An Ethernet frame should arrive on eth2 with destination address "
     "the same as eth2's MAC address")
)
s.expect(
    PacketInputTimeoutEvent(1.0),
    ("The hub should not do anything in response to a frame arriving with"
     " a destination address referring to the hub itself.")
)
return s
```

5. 总结与感想

实验还是有一定难度，但通过手册结合 gpt 基本都能得到解答。在 mininet 中进行 pingall 操作时，不理解为什么 hub（集线器）会导致有的包 drop，询问 gpt 得知是由于 ICMP 数据包具有特定的目标地址，在集线器上接收到这些数据包时，由于集线器无法根据目标 IP 地址过滤数据包，集线器会将它们转发到所有连接的端口，包括源主机和目标主机，最终就导致了目标 IP 地址不匹配而 drop。
